To see that gravity is much weaker than the electrostatic force, we can repeat Bohr's semi-classical derivation of the hydrogen energy levels, replacing the Coulomb force with the Newtonian gravitational force. We can do this with the following replacement:

$$\frac{e^2}{4\pi\epsilon_0} \rightarrow Gm_em_p \tag{0.1}$$

giving energy levels of

$$\begin{aligned} E &= -\left(Gm_em_p\right)^2\frac{m_e}{2n^2\hbar^2} && (0.2)\\ &= -\frac{4.23\times10^{-97}\text{ J}}{n^2} && (0.3)\\ &= -\frac{2.64\times10^{-78}\text{ eV}}{n^2} && (0.4)\end{aligned}$$

compared to the actual energy levels of hydrogen:

$$E = -\frac{13.6\text{ eV}}{n^2} \tag{0.5}$$

The radii are

$$\begin{aligned} r_n &= \frac{n^2\hbar^2}{Gm_e^2m_p} && (0.6)\\ &= \left(1.2\times10^{29}\text{ m}\right)n^2 && (0.7)\\ &= \left(1.2\times10^{38}\text{ nm}\right)n^2 && (0.8)\\ &= \left(8\times10^{17}\text{ AU}\right)n^2 && (0.9)\\ &= \left(1.27\times10^{13}\text{ ly}\right)n^2 && (0.10)\end{aligned}$$

Thus the ground state radius of gravitational hydrogen is many times larger than the visible universe, compared with the electrostatic Bohr radius of 5.29177×10^{-11} m.
