Here's another example of the magnetic dipole. We have a circular disk with surface charge density σ that is rotating at an angular speed ω . We can use the result for the magnetic dipole moment of a circular loop and integrate this to get the dipole moment for the disk.

The moment for the loop is

$$(1) \quad \mathbf{m} = \pi I r^2 \hat{\mathbf{z}}$$

The linear speed of a loop of radius r is $r\omega$ so the current at that radius is $dI(r) = r\omega\sigma dr$. The total dipole moment is then

$$(2) \quad \mathbf{m} = \pi\omega\sigma\hat{\mathbf{z}} \int_0^R r^3 dr$$

$$(3) \quad = \frac{\pi R^4}{4} \omega\sigma\hat{\mathbf{z}}$$
