The velocity addition formula in special relativity is (if  $\mathbf{v}_a$  and  $\mathbf{v}_b$  are parallel):

$$(1) \quad v_r = \frac{v_a + v_b}{1 + v_a v_b / c^2}$$

**Example.** Suppose some space pirates are fleeing from the solar system police in a spacecraft that is moving at  $\frac{3}{4}c$  (relative to the Earth). The police's spaceship is travelling at only  $\frac{1}{2}c$  but in an attempt to stop the pirates they fire a torpedo at them. The torpedo's velocity, relative to the police's ship, is  $\frac{1}{3}c$ . Using the classical velocity addition formula, the velocity of the torpedo relative to the Earth is

$$(2) \quad v_c = \frac{1}{2}c + \frac{1}{3}c = \frac{5}{6}c = \frac{10}{12}c$$

Since this is greater than  $\frac{3}{4}c = \frac{9}{12}c$ , the torpedo will eventually overtake the pirates' ship.

However, using the relativistic formula 1, the velocity of the torpedo relative to the Earth is

$$(3) \quad v_r = \frac{\frac{1}{2}c + \frac{1}{3}c}{1 + \frac{1}{6}} = \frac{5}{7}c = \frac{20}{28}c$$

This is less than  $\frac{3}{4}c = \frac{21}{28}c$  so the torpedo will never catch the pirates.
