[Griffiths's approach to the relativistic four-velocity is similar to that of Moore, although rather confusingly, he uses different notation (as well as keeping factors of c in the equations rather than setting $c = 1$). To keep the notation consistent with Griffiths, I'll use his notation here, but anyone attempting to follow both books should beware.]

We can use the conservation of relativistic energy and momentum to analyze the interaction of elementary particles. For example, a pion at rest can decay into a muon and a neutrino. Conservation of energy and 3-momentum require

$$E_\pi = m_\pi c^2 = E_\mu + E_\nu \quad (1)$$

$$\mathbf{p}_\pi = 0 = \mathbf{p}_\mu + \mathbf{p}_\nu \quad (2)$$

We can use the relation

$$E^2 - p^2 c^2 = m^2 c^4 \quad (3)$$

to relate energy and momentum. Assuming the neutrino is massless (it isn't quite, but it's close) we have

$$E_\nu = c p_\nu \quad (4)$$

while for the muon

$$E_\mu = c \sqrt{p_\mu^2 + m_\mu^2 c^2} \quad (5)$$

so

$$m_\pi c = \sqrt{p_\mu^2 + m_\mu^2 c^2} + p_\nu \quad (6)$$

But $p_\nu = -p_\mu$ from 2 so

$$m_\pi c = \sqrt{p_\mu^2 + m_\mu^2 c^2} - p_\mu \quad (7)$$

$$\sqrt{p_\mu^2 + m_\mu^2 c^2} = m_\pi c + p_\mu \quad (8)$$

$$p_\mu = \frac{m_\mu^2 - m_\pi^2}{2m_\pi} c \quad (9)$$

$$E_\mu = \frac{m_\mu^2 + m_\pi^2}{2m_\pi} c^2 \quad (10)$$

where the last line follows from 5.

The velocity of the muon can be found from

$$E_\mu = p^0 c \quad (11)$$

$$= \frac{m_\mu c^2}{\sqrt{1 - u^2/c^2}} \quad (12)$$

$$\frac{m_\mu^2 + m_\pi^2}{2m_\pi} c^2 = \frac{m_\mu c^2}{\sqrt{1 - u^2/c^2}} \quad (13)$$

$$u = c \sqrt{1 - \frac{4m_\pi^2 m_\mu^2}{(m_\pi^2 + m_\mu^2)^2}} \quad (14)$$

$$= \frac{m_\pi^2 - m_\mu^2}{m_\pi^2 + m_\mu^2} c \quad (15)$$
