The Minkowski force $\mathbf{K}$ is the rate of change of four-momentum with respect to proper time, and allows Newton's law to be written in its natural form

$$\mathbf{K} = m\alpha \tag{1}$$

where α is the proper acceleration, or second derivative of position with respect to proper time. Here we'll investigate the behaviour of a particle subject to a constant Minkowski force in one dimension.

In terms of ordinary force, we have

$$K = \frac{dp}{d\tau} = \frac{dp}{dt}\frac{dt}{d\tau} = \frac{1}{\sqrt{1-u^2/c^2}}F \tag{2}$$

The ordinary momentum p is

$$p = \frac{mu}{\sqrt{1-u^2/c^2}} \tag{3}$$

so its derivative is

$$\frac{dp}{dt} = \frac{m}{\sqrt{1-u^2/c^2}}\frac{du}{dt} + \frac{mu^2}{\left(1-u^2/c^2\right)^{3/2}}\frac{du}{dt} \tag{4}$$

Inserting this into 2 we get

$$\frac{K}{m}dt = \frac{du}{1-u^2/c^2} + \frac{u^2\,du}{\left(1-u^2/c^2\right)^2} \tag{5}$$

We can integrate both sides (using software, or integral tables) to get

$$\frac{K}{m}t + C = \frac{c}{4}\ln\left[\frac{c+u}{c-u}\right] + \frac{c^2}{4}\left[\frac{1}{c-u} - \frac{1}{c+u}\right] \tag{6}$$

where C is a constant of integration. If the initial conditions are $u = 0$ at $t = 0$, then $C = 0$ and we have

$$\frac{K}{m}t=\frac{c}{4}\ln\left[\frac{c+u}{c-u}\right]+\frac{c^2}{4}\left[\frac{1}{c-u}-\frac{1}{c+u}\right] \tag{7}$$

This is an implicit equation for the speed of the particle as a function of time. If we want the position as a function of time, we need a relation between u and x. Returning to 2 and 3 we have

$$\sqrt{1-u^2/c^2}\frac{K}{m}=\frac{d}{dt}\left(\frac{u}{\sqrt{1-u^2/c^2}}\right) \tag{8}$$

We can use the chain rule to convert the derivative on the RHS to a derivative with respect to x by multiplying both sides by dt/dx

$$\frac{dt}{dx}\sqrt{1-u^2/c^2}\frac{K}{m}=\frac{dt}{dx}\frac{d}{dt}\left(\frac{u}{\sqrt{1-u^2/c^2}}\right)=\frac{d}{dx}\left(\frac{u}{\sqrt{1-u^2/c^2}}\right) \tag{9}$$

Now $dx/dt=u$ so $dt/dx=1/u$ and

$$\frac{\sqrt{1-u^2/c^2}}{u}\frac{K}{m}=\frac{d}{dx}\left(\frac{u}{\sqrt{1-u^2/c^2}}\right) \tag{10}$$

If we call the expression in the parentheses on the RHS A, then we can integrate with respect to x (since K/m is a constant):

$$A \equiv \frac{u}{\sqrt{1-u^2/c^2}} \tag{11}$$

$$\frac{1}{A}\frac{K}{m} = \frac{dA}{dx} \tag{12}$$

$$\frac{K}{m}x+C = \frac{1}{2}A^2 \tag{13}$$

Again, starting from rest at the origin we have $u=0$ when $x=0$ so $A=0$ also, and therefore $C=0$, so we have

$$A=\frac{u}{\sqrt{1-u^2/c^2}}=\sqrt{\frac{2Kx}{m}} \tag{14}$$

At this point we could get a relation between x and t by solving 14 for u in terms of x and then substituting this into 7. For reference, we get

$$u=\sqrt{\frac{2Kx}{m}}\frac{1}{\sqrt{1+2Kx/mc^2}} \tag{15}$$

so substituting will give something of a mess. To get the answer given in

Griffiths requires a bit of algebra, but here is how I did it. Griffiths defines the quantity z as

$$z \equiv \sqrt{\frac{2Kx}{mc^2}} \tag{16}$$
$$= \frac{A}{c} \tag{17}$$
$$= \frac{u}{c\sqrt{1-u^2/c^2}} \tag{18}$$

The quantities appearing in Griffiths's answer are

$$\sqrt{1+z^2} = \frac{c}{\sqrt{c^2-u^2}} \tag{19}$$
$$z\sqrt{1+z^2} = \frac{u}{c\left(1-u^2/c^2\right)} \tag{20}$$

We can rewrite 7 to get

$$\frac{2Kt}{mc} = \frac{1}{2}\ln\left[\frac{c+u}{c-u}\right] + \frac{c}{2}\left[\frac{1}{c-u} - \frac{1}{c+u}\right] \tag{21}$$

We'll deal with the logarithm first. Its argument is

$$\frac{c+u}{c-u} = \frac{(c+u)^2}{c^2\left(1-u^2/c^2\right)} \tag{22}$$
$$= \frac{2u}{c\left(1-u^2/c^2\right)} + \frac{u^2+c^2}{c^2-u^2} \tag{23}$$
$$= \frac{2u}{c\left(1-u^2/c^2\right)} + \frac{c^2-u^2+2u^2}{c^2-u^2} \tag{24}$$
$$= \frac{2u}{c\left(1-u^2/c^2\right)} + 1 + \frac{2u^2}{c^2\left(1-u^2/c^2\right)} \tag{25}$$

Now we also have

$$\left(z+\sqrt{1+z^2}\right)^2 = 2z^2 + 2z\sqrt{1+z^2} + 1 \tag{26}$$
$$= \frac{2u^2}{c^2\left(1-u^2/c^2\right)} + \frac{2u}{c\left(1-u^2/c^2\right)} + 1 \tag{27}$$
$$= \frac{c+u}{c-u} \tag{28}$$

Therefore

$$\frac{1}{2}\ln\left[\frac{c+u}{c-u}\right] = \ln\sqrt{\frac{c+u}{c-u}} \tag{29}$$

$$= \ln\left(z+\sqrt{1+z^2}\right) \tag{30}$$

For the second term in 21, we have

$$\frac{c}{2}\left[\frac{1}{c-u}-\frac{1}{c+u}\right] = \frac{c}{2}\frac{2u}{c^2\left(1-u^2/c^2\right)} \tag{31}$$

$$= \frac{u}{c\left(1-u^2/c^2\right)} \tag{32}$$

$$= z\sqrt{1+z^2} \tag{33}$$

Putting it all together, we have

$$\frac{2Kt}{mc} = \ln\left(z+\sqrt{1+z^2}\right)+z\sqrt{1+z^2} \tag{34}$$
