Post date: 13 Dec 2014.

Suppose we have a one-dimensional chain of $N$ equal masses $m$ connected by identical springs of rest length $a$ and spring constant $k$, so that mass $j$ has a rest position of $ja$, $j = 0 \ldots N-1$. The masses can move only in the $x$ direction, and moving one mass extends the spring on one side while compressing the spring on the other side. The total energy of the system is the sum of the kinetic energies of the masses and the potential energies of the springs. The kinetic energy of mass $j$ is just $\frac{1}{2}mv_j^2$ or, in terms of the momentum operator

$$T_j = \frac{\hat{p}_j^2}{2m}$$

The potential energy of the spring connecting masses $j$ and $j + 1$ is $\frac{1}{2}k(\Delta x)^2$ where $\Delta x$ is the amount the spring is stretched (or compressed). $\Delta x$ is the difference between the amounts that the two masses on either end have moved from their equilibrium positions, so if we call $x_j$ the amount by which mass $j$ has moved from position $ja$, then

$$\Delta x_{j,j+1} = x_{j+1} - x_j$$

$$V_j = \frac{1}{2}K(\hat{x}_{j+1} - \hat{x}_j)^2$$

where we’ve added hats to show that $\hat{x}_j$ is an operator. Therefore the hamiltonian of the system is

$$\hat{H} = \sum_j \frac{\hat{p}_j^2}{2m} + \sum_j \frac{1}{2}K(\hat{x}_{j+1} - \hat{x}_j)^2$$

As it stands, the hamiltonian contains terms such as $k\hat{x}_j\hat{x}_{j+1}$ in which the spatial terms of two masses occur in a product, that is, it contains coupled terms. We can convert the hamiltonian to an uncoupled system in which
it consists of a sum of terms where each term refers to only a single index. This is done by using discrete Fourier transforms. A discrete Fourier transform assumes that the raw data (the values of $x_j$ and $p_j$) are samples at equally spaced intervals and that the behaviour outside the observed range (that is, for $j < 0$ and $j \geq N$) is periodic, so that it repeats the observed behaviour with a period of $Na$. This is equivalent to imposing periodic boundary conditions so that

$$x_{j+N} = x_j$$  \hspace{1cm} (5)

$$p_{j+N} = p_j$$  \hspace{1cm} (6)

The discrete Fourier transform is then

$$x_j = \frac{1}{\sqrt{N}} \sum_k \tilde{x}_k e^{ikja}$$  \hspace{1cm} (7)

$$p_j = \frac{1}{\sqrt{N}} \sum_k \tilde{p}_k e^{ikja}$$  \hspace{1cm} (8)

[This transform differs from the one in the earlier reference in that it has a factor of $1/\sqrt{N}$ in front. All that matters is that the product of this factor with the corresponding factor in front of the inverse transform is $1/N$.] The index $k$ is the frequency and because of the periodic boundary conditions, we must have

$$e^{ikja} = e^{ik(j+N)a}$$  \hspace{1cm} (9)

$$e^{ikNa} = 1$$  \hspace{1cm} (10)

$$k = \frac{2\pi m}{Na}$$  \hspace{1cm} (11)

for an integer $m$ which is in a range such that $ka$ varies over $2\pi$. Any range of $m$ that satisfies this condition would do, but it turns out to be most convenient to choose $-\frac{N}{2} < m \leq \frac{N}{2}$. This gives $-\pi < ka \leq \pi$.

We can now work out the hamiltonian using the Fourier transformed variables $\tilde{x}_k$ and $\tilde{p}_k$. First, the kinetic energy term:

$$\sum_j p_j^2 = \sum_j \left( \frac{1}{\sqrt{N}} \sum_k \tilde{p}_k e^{ikja} \right) \left( \frac{1}{\sqrt{N}} \sum_{k'} \tilde{p}_{k'} e^{ik'ja} \right)$$

$$= \frac{1}{N} \sum_j \sum_k \sum_{k'} \tilde{p}_k \tilde{p}_{k'} e^{i(k+k')ja}$$  \hspace{1cm} (12)

$$= \frac{1}{N} \sum_j \sum_k \sum_{k'} \tilde{p}_k \tilde{p}_{k'} e^{i(k+k')ja}$$  \hspace{1cm} (13)
COUPLED OSCILLATORS IN TERMS OF CREATION AND ANNIHILATION OPERATORS: PHONONS

We can now make use of the sum (derived from a geometric series):

$$\sum_{j} e^{i2\pi mj/N} = N\delta_{m,0}$$

(14)

This means that

$$\sum_{j} e^{i(k+k')ja} = N\delta_{k,-k'}$$

(15)

so

$$\sum_{j} p_{j}^2 = \sum_{k} \tilde{p}_{k}\tilde{p}_{-k}$$

(16)

For the potential energy term we have

$$\sum_{j} (\hat{x}_{j+1} - \hat{x}_{j})^2 = \frac{1}{N} \sum_{j} \left( \sum_{k} \tilde{x}_{k} e^{i k (j+1)a} - \sum_{k} \tilde{x}_{k} e^{i k ja} \right) \left( \sum_{k'} \tilde{x}_{k'} e^{i k' (j+1)a} - \sum_{k'} \tilde{x}_{k'} e^{i k' ja} \right)$$

(17)

$$= \frac{1}{N} \sum_{j} \left( \sum_{k} \tilde{x}_{k} e^{i k ja} \left( e^{ika} - 1 \right) \right) \left( \sum_{k'} \tilde{x}_{k'} e^{i k' ja} \left( e^{ik'a} - 1 \right) \right)$$

(18)

$$= \frac{1}{N} \sum_{j} \sum_{k} \sum_{k'} \tilde{x}_{k} \tilde{x}_{k'} e^{i(k+k')ja} \left( e^{ika} - 1 \right) \left( e^{i k'a} - 1 \right)$$

(19)

$$= \sum_{k} \tilde{x}_{k} \tilde{x}_{-k} \left( e^{ika} - 1 \right) \left( e^{-ika} - 1 \right)$$

(20)

$$= \sum_{k} \tilde{x}_{k} \tilde{x}_{-k} \left( 2 - \left( e^{ika} + e^{-ika} \right) \right)$$

(21)

$$= 2 \sum_{k} \tilde{x}_{k} \tilde{x}_{-k} (1 - \cos(ka))$$

(22)

$$= 4 \sum_{k} \tilde{x}_{k} \tilde{x}_{-k} \sin^2 \frac{ka}{2}$$

(23)

It might not seem that we’ve made much progress, since now both the kinetic and potential energy terms appear to be coupled, involving products of $+k$ and $-k$ modes. However, the inverses of 7 and 8 are
\[ \tilde{x}_k = \frac{1}{\sqrt{N}} \sum_j x_j e^{-ikja} \]  
\[ \tilde{p}_k = \frac{1}{\sqrt{N}} \sum_j p_j e^{-ikja} \]  

Since \( x_j \) and \( p_j \) are observables, they must be hermitian operators, so

\[ \tilde{x}_k^\dagger = \tilde{x}_k \quad \text{and} \quad \tilde{p}_k^\dagger = \tilde{p}_k \]

Therefore

\[ \sum_j p_j^2 = \sum_k \tilde{p}_k \tilde{p}_k^\dagger \]

\[ = \sum_k \tilde{p}_k \tilde{p}_k^\dagger \]  
\[ \sum_j (\tilde{x}_{j+1} - \tilde{x}_j)^2 = 4 \sum_k \tilde{x}_k \tilde{x}_{-k} \sin^2 \frac{ka}{2} \]  
\[ = 4 \sum_k \tilde{x}_k \tilde{x}_k^\dagger \sin^2 \frac{ka}{2} \]

\[ \hat{H} = \frac{1}{2m} \sum_k \tilde{p}_k \tilde{p}_k^\dagger + \frac{1}{2} \sum_k \tilde{x}_k \tilde{x}_k^\dagger \sin^2 \frac{ka}{2} \]  
\[ = \frac{1}{2m} \sum_k \tilde{p}_k \tilde{p}_k^\dagger + \frac{1}{2} m \sum_k \omega_k^2 \tilde{x}_k \tilde{x}_k^\dagger \]  
\[ = \frac{1}{2m} \sum_k \tilde{p}_k \tilde{p}_{-k} + \frac{1}{2} m \sum_k \omega_k^2 \tilde{x}_k \tilde{x}_{-k} \]

where

\[ \omega_k^2 \equiv 4 \frac{K}{m} \sin^2 \frac{ka}{2} \]  

That is, we’ve managed to write the hamiltonian as the sum over uncoupled oscillators, where oscillator \( k \) has frequency \( \omega_k \). The catch is that the operators \( \tilde{p}_k \) and \( \tilde{x}_k \) are in frequency space, not ‘normal’ space, so they are
COUPLED OSCILLATORS IN TERMS OF CREATION AND ANNIHILATION OPERATORS; PHONONS

the ‘momentum’ and ‘position’ operators for the modes of oscillation of the coupled set of oscillators.

The formal equivalence of the hamiltonian in mode space with the hamiltonian for a single oscillator in normal space means we can define creation and annihilation operators in the same way. That is (reverting to ‘hat’ notation to indicate operators):

\[ \hat{a}^\dagger_k = \frac{1}{\sqrt{2\hbar \omega_k}} \left[ -i \hat{p}_k + m\omega_k \hat{x}_k^\dagger \right] \] (36)

\[ \hat{a}_k = \frac{1}{\sqrt{2\hbar \omega_k}} \left[ -i \hat{p}_{-k} + m\omega_k \hat{x}_{-k} \right] \] (37)

Inverting these equations, we get (note that \( \omega_k \) is always the positive square root of 35):

\[ \hat{a}^\dagger_{-k} = \frac{1}{\sqrt{2\hbar \omega_k}} \left[ -i \hat{p}_{-k} + m\omega_k \hat{x}_{-k} \right] \] (39)

\[ \hat{a}^\dagger_{-k} + \hat{a}_k = \frac{2}{\sqrt{2\hbar \omega_k}} m\omega_k \hat{x}_k \] (40)

\[ \hat{x}_k = \sqrt{\frac{\hbar}{2m\omega_k}} \left( \hat{a}^\dagger_{-k} + \hat{a}_k \right) \] (41)

\[ \hat{p}_k = i \sqrt{\frac{\hbar m\omega_k}{2}} \left( \hat{a}^\dagger_{-k} - \hat{a}_k \right) \] (42)

**Example.** We can express the original space coordinate \( x_j \) in terms of the creation and annihilation operators. From [7]

\[ x_j = \frac{1}{\sqrt{N}} \sum_k \hat{x}_k e^{ikja} \] (43)

\[ = \sqrt{\frac{\hbar}{2mN}} \sum_k \frac{1}{\sqrt{\omega_k}} \left( \hat{a}^\dagger_{-k} + \hat{a}_k \right) e^{ikja} \] (44)

\[ = \sqrt{\frac{\hbar}{2mN}} \sum_k \frac{1}{\sqrt{\omega_k}} \left( \hat{a}^\dagger_k e^{-ikja} + \hat{a}_k e^{ikja} \right) \] (45)

where the last line follows from the fact that we’re summing over \( k \) over a range of values symmetric about \( k = 0 \) so we can replace \( k \) by \(-k\) and get the same sum.
Inserting $41$ and $42$ into $34$ we get

$$\hat{H} = -\frac{\hbar}{4} \sum_k \omega_k \left( \hat{a}_k^\dagger \hat{a}_k - \hat{a}_k \hat{a}_k^\dagger \right) + \frac{\hbar}{4} \sum_k \omega_k \left( \hat{a}_k^\dagger + \hat{a}_k \right) \left( \hat{a}_k^\dagger + \hat{a}_k \right)$$

(46)

$$= \frac{\hbar}{2} \sum_k \omega_k \left( \hat{a}_k^\dagger \hat{a}_k + \hat{a}_k \hat{a}_k^\dagger \right)$$

(47)

Since the commutator is

$$\left[ \hat{a}_k, \hat{a}_k^\dagger \right] = 1$$

(48)

we get

$$\hat{H} = \frac{\hbar}{2} \sum_k \omega_k \left( \hat{a}_k^\dagger \hat{a}_k + 1 + \hat{a}_k \hat{a}_k^\dagger \right)$$

(49)

$$= \sum_k \hbar \omega_k \left( \hat{a}_k^\dagger \hat{a}_k + \frac{1}{2} \right)$$

(50)

$$= \sum_k \hbar \omega_k \left( \hat{a}_k^\dagger \hat{a}_k + \frac{1}{2} \right)$$

(51)

That is, the hamiltonian is the sum of the hamiltonians for individual oscillators in terms of creation and annihilation operators. The 'particles' that are created or annihilated are the modes of oscillation in the chain of 'real' oscillators; these modes are called phonons, since they are reminiscent of sound waves passing through a medium.
